The #1 Complaint of File Folder Users is Paper Cut Injuries

How Can Such a Tiny Thing Be Such a Big Problem?

Ask anyone who works in an office environment. According to statistics, over 50% of administrative assistants suffer a file folder papercut every month, and over half of those workers are injured multiple times. In doctors' offices and other medical environments where exposure to germs is common, such injuries can lead to infection. The end results can be unhappy workers and reduced productivity.

The Cruellest Cut – Why Does it Hurt So Much?

A paper cut is similar to a cut with a razor blade, with one major difference. While a clean razor leaves little behind to irritate the wound, a paper cut can really sting.

When paper slices into the skin, tiny particles can remain in the wound and stimulate pain receptors. And because the cut is usually small and shallow, the skin on either side of the wound closes quickly, potentially trapping the tiny particles inside. The result is a great deal of pain from an injury you can barely detect.*

Reduce Paper Cut Injuries by Up to 70%.

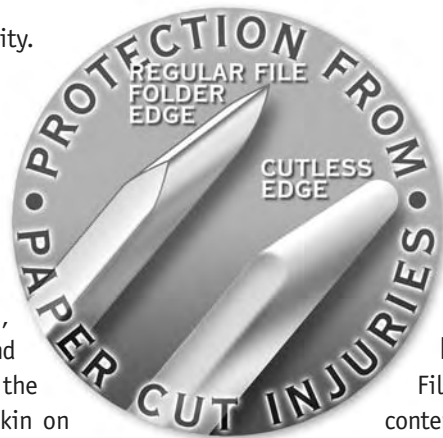

The researchers at International Paper have now created the solution to the problem. CutLess Paper is a revolutionary new stock specifically developed to reduce the incidence of paper cuts. A special formula is used at the manufacturing stage to produce a thicker stock with a softer edge. There's no decline in durability and a 30% MD stiffness advantage over regular side tab folder applications.

The result is an innovative new product that produces very big results. Independent lab results have shown that using file folders produced from new CutLess Paper can lower paper cut injuries by over 70%.

Guard Yourself and Your Employees with a Cutting-Edge Remedy to an Age-Old Problem.

File folders have been protecting their contents for many generations – but now they can do even more. Choose CutLess File Folders to protect the most valuable resources a company possesses – its employees.

CUTLESS
